

Minecraft Server Status for Discord

- [1. General](#)
- [2. How to Install](#)
- [3. Planned Features](#)

1. General

This bot reads a minecraft server IP from `minecraft_server_ip.config` and connects to the discord bot with token `discord_bot.token` to display the current status of the specified minecraft server via its rich presence title and bot status. It states whether the minecraft server is:

- offline
- online, current and maximum possible players online, and a player name list should there be any online

2. How to Install

As far as I know, there is currently no way of having rich presences on a per server basis. That's why you can not use this bot by just inviting it to your server. To use this bot:

1. Download the source code or download a release `Minecraft Server Status for Discord.exe`.
2. Copy your discord bot token into `discord_bot.token`.
 1. Create a discord application [here](#).
 2. Create your bot.
 3. Add it to your server.
 4. Copy your token into `discord_bot.token`.If you don't know how to do these steps, I recommend [this tutorial](#).
3. Copy your minecraft server IP into `minecraft_server_ip.config`.
4. Execute `main_outer.py` with python or execute the compiled `Metric METAR for Discord.exe`.

3. Planned Features

I want to move the current IP and player list into a separate, multiline text field. I think `discord.Activites.details` should be what I'm looking for but I can't make it work somehow. Any help would be greatly appreciated!
