Minecraft Server Status for Discord

1. General

This bot loads a minecraft server IP from `minecraft_server_ip.config`, connects to the discord bot with token `discord_bot.token`, and displays the current status of the specified minecraft server via its rich presence title and bot status. It states either:

- offline, current global IP
- current and maximum possible players online, a player name list should there be any online, current global IP

2. How to Install

As far as I know, there is currently no way of having rich presences on a per server basis. That's why you can not use this bot by just inviting it to your server. To use this bot:

1. Download the source code or download a release `Minecraft Server Status for Discord.exe`.

2. Copy your discord bot token into `discord_bot.token`.

   1. Create a discord application here.
   2. Create your bot.
   3. Add it to your server.
   4. Copy your token into `discord_bot.token`.

   If you don't know how to do these steps, I recommend this tutorial.

3. Copy your minecraft server IP with port into `minecraft_server_ip.config`.

4. Execute `main_outer.py` with python or execute the compiled `Metric METAR for Discord.exe`.

3. Planned Features

I want to move the current IP and player list into a separate, multiline text field. I think `discord.Activites.details` should be what I'm looking for, but I can't make it work for some reason. Any help would be greatly appreciated!
